

Sample Case: Automotive Manufacturer K Company

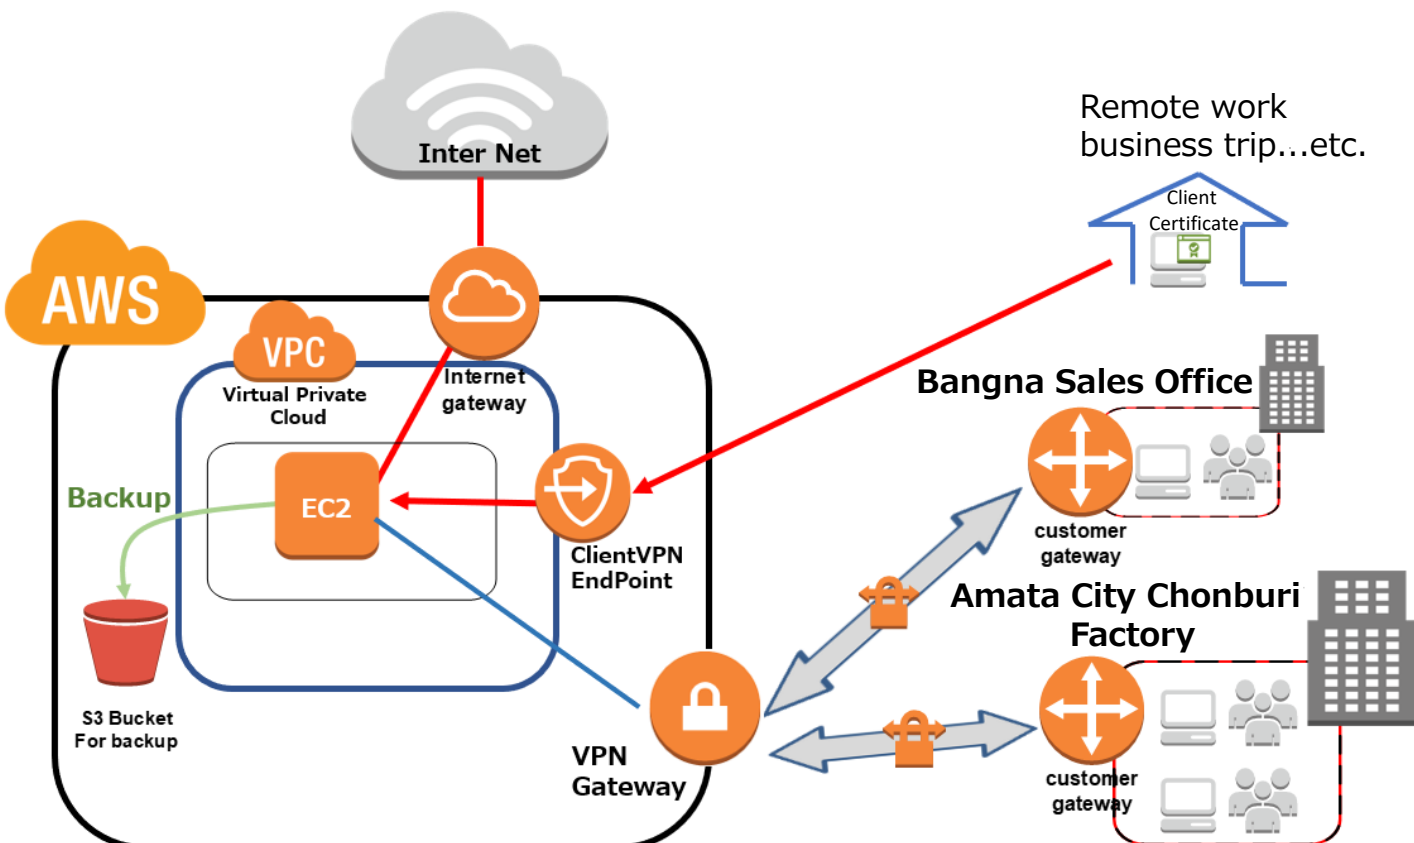

Background of Requirement

- This customer used to handle in-house server system but it caused time consuming for data backup and its maintenance.
- They want to share the in-house server data at the sales office in Bangna.
- They want to permit an access to the server for a person from outside.

Concept Proposal

- It realized this system made the secure connection of Site- to- Site VPN for AWS from 2 locations.
- They built a Client VPN environment to improve the usability of accessing the server from outside and realized that it is able to accept only from a selected device which is granted a client certification at the same time.
- This system reduces man power to maintain the usage of AWS dramatically.
(it is also used for Hardware trouble, additional HDD for over capacity, regular data backup and etc.)
- A server room and its temperature control system are not needed.
- A server becomes cost from asset.
